

1  
2 **ABSTRACT**

3       In accordance with certain described implementation(s), a coordinating  
4 device performs bandwidth allocation procedures based on information from  
5 previously-unfulfilled bandwidth allocation requests and responsive to current  
6 bandwidth allocation requests. The current bandwidth allocation requests stipulate  
7 current requested bandwidth amounts for multiple streams, and the current  
8 bandwidth allocation requests may be received from multiple entities having the  
9 multiple streams. The information from previously-unfulfilled bandwidth  
10 allocation requests is taken into account when allocating available bandwidth  
11 between/among the multiple streams of the multiple entities for the current  
12 requested bandwidth amounts.
